**1. RELOAD WEIGHT SYSTEM**

**THE HIGH-RESPONSE BIG BAIT FOR ALL RANGES**

From high-floating to sinking, our Reload Weight System adjusts floatability, and the light body with no need of a heavy tackle makes KRK205 excellent to maneuver in any range. This big bait adds more technical moves and fun into the game like you have never known before. KRK205 allows the exciting top water game with sharp sliding and walking the dog, attracting the big bass to slice the water surface. It handles swimming in S-shape, waking, slide & dart, high-speed stop & go, you name it. Its readiness to all situations comes from the firm stability and the flat body that responds quickly to the rod handling – the perfected setting unique to KRK205. We preserved the big bait form - one of the huge factors that attracts the bass. KRK205 also responds to the conditions of the field and bass immediately, assisting you in quick actions. This versatile and tireless big bait not only satisfies seasoned anglers, but also educates those who have avoided big baits how effective and amazingly rewarding it is.

You can attach up to 4 tungsten weights. From high-floating (surface) to sinking (deep), KRK205's original weight system allows 5 different floating ranges according to your situations.

**2. WEIGHT SETTING**

\*Floating and diving ranges are based on the tests at the water temperature of 10° C (50° F) with 20lb Fluoro Carbon line.

**\*High Floating**

Specialized in walking the dog and sliding at the surface. The flat body produces strong slapping sound on the water and the splashing action that choreograph a predator's biting and the bait fish scrambling away. Wait to see an exciting scene where the big bass somersaults out of the water.

**\*High Floating**

Walking the dog, skating, plus diving – KRK205 imitates the big bait fish that picks at a feed on the surface and dives down.

**\*Floating**

Retrieving in S-shape and a short jerk to slide-dart down to 30cm (1 foot)-deep. Floating action right after a stop sometimes invites exploding bites. In retrieving, KRK205 is good at waking on the backwash.

**\*Slow Floating**

Retrieving in S-shape and a slide-dart down to 80cm (2.6 feet)-deep. Mixing consecutive darting and extra-fast retrieving to entice fish, then let it float slowly for a nice effect. Adding steal or lead weights can adjust the suspending.

**\* Sinking**

The steady swimming posture and an alluring dart take care of the middle to deep range with the heaviest setting. Even during sinking, KRK205's high response never wanes.

**\*Rattle Sound Setting**

When you set 1 to 3 tungsten balls without a plastic ball, it gives a rattle-sound effect. The weight that rolls in the open weight space makes the muffled sound at each jerk and twitch, coaxing a bite.

### 3. BODY FORM

The light-weight flat body maintains the prominent presence – the strength of big baits – while achieving agile handling, unlike regular big baits. KRK205 doesn't tire anglers, but helps them stay focused on various technical game plans.

KRK205's wide flat surface not only creates robust flashing, but also slaps the water surface with force and stirs the stream mightily in the water.

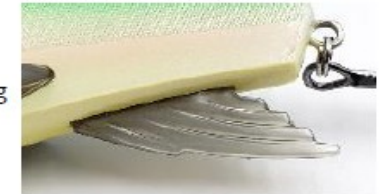

### 4. STABILIZER FIN

Controlling the nose-dive, the stabilizer fin helps keep KRK205's head up. During jerking and twitching, it reduces the line-tangling.

By restraining excess rolling, the perpendicular fin stabilizes the swimming and allows sharp and extended darting.

### 5. HOOK SETTING

So that you can change the hook location according to your situation, 3 hook eyes are provided. The default hook set is great for swimming in the middle range with 3 to 4 weights.

From topwater to the shallow range, where launching bites from below often occur, a double-hook setting on the front is effective. It especially works well with up to 2 weights.

The hooking rate is the highest with the 3-hook setting. It's best to adjust the hook size while you are checking the balance of the bait's action.

In the situation where a chase doesn't lead to a bite, a feather hook on the tail may help.

### SPARE PARTS

A set of weights

2 tangsten weights,  
2 plastic balls,

A set of PVC parts

2 side fins,  
1 perpendicular fin,  
1 weight cover,

4 Joint pads

work on both  
right and left

**1. MATERIAL**

On the back and the stomach, materials with drastically different weight of salt contents are used to secure an ideal falling posture. The upper fin is soft and light, while the lower tail is created for strong, graceful actions with the heavier material. The high-density bait is harder to break and lasts well on the hook. The original formula is made of extracts from bait fish and shellfish.

**2. BODY FORM**

The vertical flat body creates the water movement that signals its presence. The smooth recess is on both sides of the body to catch water and push it. This curve was achieved by thoroughly polishing up the mold to bring out the mirroring effect. We insisted on this feature to generate natural flashing, especially in a rolling action as in the mid strolling. The unique tail, heavy at the tips, catches the flow of water and automatically sways right and left. When that action causes the fin to flag, ISANA's characteristic, realistic tail action comes alive. The concave-convex back surface aim to capture the water better and help to hide the hook just a-skin-layer deep.

**3. EXAMPLES OF SETTING**

ISANA is almighty for any rig. And this stick bate changes its characteristics depending on a rig, enticing bites with the most potent action – twitches, jerks, lifts and falls, or just swims straight – that will bring sure results.

**1. THE ORIGINAL SOFT BLADE**

Not too hard, not too soft, the perfect firmness of PVC soft blade came through vigorous tests. The soft pulsation entices a bite without causing suspicion and communicates clear vibration to the angler. The flexible blade reduces the hinderance to hooking, improving the chance to catch. By Inserting a metal plate added strength is realized that is not in soft material alone.

**2. HEAD SHAPE**

Low center of gravity in the head with the weight in front is designed mainly for slow tracing within a certain range. With stability and subdued buoyancy, the design adds security to this new method of slow rolling by a chatter bait.

**3. THE SKIRT & ORIGINAL HOOK**

The uneven skirt captures water and create complex streams even during a slow retrieve. The design aims for a prominent presence. The original hook boasts a high hooking rate that can stand even big bass. The double-hold wire firmly keeps the trailer and reduces damage. All these details show our commitment to the quality.

**ULTIMATE NATURAL SWIMMING.**

Tiny MASAMUNE is an I-shaped lifelike bait. As the built-in “Water duct” takes water in and out, it eliminates the body movement. What entices bites is the micro-vibration of the elastomer tail. Tiny MASAMUNE just swims straight with only its tail vibrating. The unique action imitates the bait fish separated from a school, weary and afraid of an attack from bass. Even the most cautious bass, that never opens its mouth to any approach, would not hesitate to bite. Tiny MASAMUNE comes in the size of common bait fish seen in all fields and works not only in big lakes, but also in reservoirs, ponds and rivers. In addition, the insertable plate weight can freely control the floatability, allowing you to quickly change your mind between floating and sinking. From the surface to middle range, you can manage your game plan depending on your situations. Tiny MASAMUNE, with its exceptional capacity to seduce bites, also works as a search bait by retrieving over a wide area. This I-shaped swim bait, unlike any other, will bring you steady results

**1. BODY FORM & HOOK SETTING**

The slender 100mm body was chosen after considering the size of bait fish seen in many fields. We designed the most familiar size and shape that the average to monster bass would eat without hesitation.

A feather hook is added that changes the overall shape according to the fast or slow retrieving speed. It adds natural swaying motions to the body’s no-motion for a higher biting rate.

**2. WATER DUCT**

We came up with our original design “Water duct” that runs through the body after meticulously exploring no swimming action. The water flow caused by retrieving enters the body of Tiny MASAMUNE and controls its action. The body maintains “no action” regardless of the effects from the rod and line handling.

**3. INSERTABLE PLATE WEIGHT**

The insertable plate weight can adjust floatability easily and quickly without interfering the Water duct's function, enabling a fast switch between sinking and floating. The plate allows you to plan your game depending on the bass' agility, the range or field.

**4. MICRO VIBRATION TAIL**

The soft elastomer tail adds the micro vibration to the no-action body. Retrieving causes the high-frequency vibration. Not only Tiny MASAMUNE's lifelike motion attracts bass, but its visual appeal also helps anglers keep enjoying the cast.
